

Adult emerald ash borer

What is Emerald Ash Borer?

The **Emerald Ash Borer (EAB)** is an invasive beetle from Asia. It was first discovered in the United States during the summer of 2002 near Detroit, Michigan. EAB has quickly become one of the most destructive and costly forest insects in urban forest history.

EAB larvae feed on the inner bark of ash trees which disrupts the tree's ability to transport water and nutrients. Once an ash tree is infested, it has almost zero chance of survival. The only way to protect your tree is with treatment.

EAB populations can grow exponentially each year because the beetle has few natural predators and our ash trees have limited natural defenses. When EAB is not managed, annual ash tree deaths can quickly overwhelm the resources required to remove dead and dying trees.

A healthy ash tree will transport water through the current year's growth ring. The larvae of the beetles eat the growth rings under the bark. A heavily infested tree can no longer transport water and the top dies. The beetles will move on to the next ash tree.

Is EAB in My City?

EAB was confirmed in Red Wing, April 2017. Like most Minnesota cities, Red Wing has an abundance of ash trees growing on public and private property. A 2010 DNR survey found more than 10,300 ash trees in Red Wing. It is estimated that over 30 percent of trees in the Twin Cities area are ash trees.

What are My Choices if I have an Ash Tree?

If you have an ash tree, now is the time to decide what to do. Ash trees can be protected or removed. Red Wing is encouraging residents to treat large, well-placed, healthy private ash trees as part of an EAB treatment program.

Considerations for Treatment:

- Tree size greater than 10" in diameter.
- Tree is not competing with other trees or infrastructure.
- Tree shows no more than 30% of canopy decline if infestation is suspected.

Treating an ash tree is more cost effective than removal and replacement, plus maintains the tree benefits and value of a mature tree to your property!

Protecting your ash tree for 20 years is less than the average cost to remove and replace it.

EAB larvae damage on ash tree.
